Math 300 NTI Lesson 1

Data with R

Professor Bradley Warner

June, 2022

Contents

Objectives	1
Reading	1
Lesson	1
Documenting software	4

Objectives

- 1. Install, load, and use R packages.
- 2. Explore data sets with R functions to include glimpse(), View(), kable() and \$.
- 3. Identified and justify if a variable is for identification or measurement and if measurement if it is categorical or quantitative.
- 4. Understand and practice the tips on learning to code to include using help functions and reading error messages

Reading

Chapter 1

Lesson

Remember that you will be running this more like a lab than a lecture. You want to get them using R and answering questions. The focus will be on answering the learning checks. This will require to use our book and to use RStudio. Those should be our primary teaching tools.

- Have a copy of the textbook open in a browser tab, the NITs in a browser tab, and the student notes Rmd open. Work through the Rmd with them using the answers in the NTI. You can go back to the book to bring clarity to specific points.
- Work through the learning checks LC1.1 LC1.7. You may not be able to get through all of them. You can pick and choose which you want to emphasize in class. Refer to the book to get the question and appropriate reference material.

- Have them knit their work prior to leaving class. You may want to show how to insert a code chunk using Ctrl-Alt-I. At some point in the semester, you can discuss options in code chunks.
- To comment out code in a code chunk use the # symbol.
- We have an additional html document that they can read through that gives more information on R. It is *Intro_to_R_RStudio_desktop.html*.

LC 1.1 (Objective 1)

```
# Loading libraries needed
library(dplyr)
library(nycflights13)
```

(LC1.1) Repeat the above installing steps, but for the dplyr, nycflights13, and knitr packages. This will install the earlier mentioned dplyr package, the nycflights13 package containing data on all domestic flights leaving a NYC airport in 2013, and the knitr package for writing reports in R.

• These may be installed. If so, show them how to load package using the Packages tab in RStudio. *

LC 1.2 (Objective 1)

(LC1.2) "Load" the dplyr, nycflights13, and knitr packages as well by repeating the above steps.

Solution: If the following code runs with no errors, you've succeeded!

```
library(dplyr)
library(nycflights13)
library(knitr)
```

LC 1.3 (Objective 2)

(LC1.3) What does any ONE row in this flights dataset refer to?

- A. Data on an airline
- B. Data on a flight
- C. Data on an airport
- D. Data on multiple flights

Solution: This is data on a flight. Not a flight path! Example:

- a flight path would be United 1545 to Houston
- a flight would be United 1545 to Houston at a specific date/time. For example: 2013/1/1 at 5:15am.

LC 1.4 (Objective 3, 4)

(LC1.4) What are some examples in this dataset of **categorical** variables? What makes them different than **quantitative** variables?

Solution: Hint: Type ?flights in the console to see what all the variables mean!

- Categorical:
 - carrier the company
 - dest the destination
 - flight the flight number. Even though this is a number, its simply a label. Example United 1545 is not less than United 1714
- Quantitative:
 - distance the distance in miles
 - time_hour time

Go to R and walk through the help. They struggle with using help

LC 1.5 (Objective 3)

(LC1.5) What properties of the observational unit do each of lat, lon, alt, tz, dst, and tzone describe for the airports data frame? Note that you may want to use ?airports to get more information.

Solution: lat long represent the airport geographic coordinates, alt is the altitude above sea level of the airport (Run airports %>% filter(faa == "DEN") to see the altitude of Denver International Airport), tz is the time zone difference with respect to GMT in London UK, dst is the daylight savings time zone, and tzone is the time zone label.

LC 1.6 (Objective 3)

(LC1.6) Provide the names of variables in a data frame with at least three variables in which one of them is an identification variable and the other two are not. In other words, create your own tidy dataset that matches these conditions.

Solution:

```
LC6 <- tibble(id=c(1,2,3),gpa=c(3.4,2.7,3.6),pea=c(2.7,3.0,3.3))
```

glimpse(LC6)

```
## Rows: 3
## Columns: 3
## $ id <dbl> 1, 2, 3
## $ gpa <dbl> 3.4, 2.7, 3.6
## $ pea <dbl> 2.7, 3.0, 3.3
```

- In the example, id is an identification variable as it identifies the observation in question.
- Anything else pertains to measurements: gpa and pea.

We can also look at the weather data object.

glimpse(weather)

```
## Rows: 26,115
## Columns: 15
## $ origin
                                                                <chr> "EWR", "EWR"
## $ year
                                                                <int> 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2013, 2
## $ month
                                                                ## $ day
                                                                <int> 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 13, 14, 15, 16, 17, 18, ~
## $ hour
                                                                <dbl> 39.02, 39.02, 39.02, 39.92, 39.02, 37.94, 39.02, 39.92, 39.~
## $ temp
## $ dewp
                                                                <dbl> 26.06, 26.96, 28.04, 28.04, 28.04, 28.04, 28.04, 28.04, 28.04
## $ humid
                                                                <dbl> 59.37, 61.63, 64.43, 62.21, 64.43, 67.21, 64.43, 62.21, 62.~
## $ wind dir
                                                                <db1> 270, 250, 240, 250, 260, 240, 240, 250, 260, 260, 260, 330,~
## $ wind_speed <dbl> 10.35702, 8.05546, 11.50780, 12.65858, 12.65858, 11.50780, ~
## $ precip
## $ pressure
                                                                <dbl> 1012.0, 1012.3, 1012.5, 1012.2, 1011.9, 1012.4, 1012.2, 101~
                                                                ## $ visib
## $ time_hour <dttm> 2013-01-01 01:00:00, 2013-01-01 02:00:00, 2013-01-01 03:00~
```

- The combination of origin, year, month, day, hour are identification variables as they identify the observation in question.
- Anything else pertains to measurements: temp, humid, wind_speed, etc.

LC 1.7 (Objective 2, 4)

(LC1.7) Look at the help file for the airports data frame. Revise your earlier guesses about what the variables lat, lon, alt, tz, dst, and tzone each describe.

Solution:

Type ?airports in the console to see what all the variables mean.

Documenting software

File creation date: 2022-06-04
R version 4.1.3 (2022-03-10)
dplyr package version: 1.0.9

• nycflights13 package version: 1.0.2
